

ABSTRACT OF THE DISCLOSURE

The suspended service recovery system is configured with a suspend-state analyzing module 14 to analyze a suspend-state and to extract required data to recover
5 the suspend-state if a service being provided via a communication network 4 is suspended, a suspend-state representation module 12 to convert a result of the analysis to state-description data D2 according to a prescribed format, a storing device 3 to store the state-description data D2, a memory device 21 to memorize a recovery table which correlates each item of the state-description data D2 with a data type that can be
10 processed on a client terminal 2, a state-description transforming module 24 to transform the state-description data D2 retrieved from the storing device 3 based on the recovery table, and a recovery-state generating module 25 to recover the suspended service.
